**Psoriasis (PsO) is a complex disease with many barriers to optimal care**

Psoriasis is a common, chronic disease that has a negative physical, psychological and social burden on patients, yet many wait several years to receive effective treatment.

---

**Objectives**

Multidisciplinary insight generation and consensus with key stakeholders dedicated to diagnosis, care, monitoring, access and patient-related outcomes...

...to drive multistakeholder action on enhancing the delivery of the future of medicine and elevating the standard of care.

---

**Epicensus Programme: Concept in a nutshell**

1. **Obtain insights from relevant multidisciplinary stakeholders** to gain a comprehensive understanding of the current SoC.

   - **21 Clinicians**
   - **12 Payors**
   - **9 Patient representatives**

   from 8 European markets complete this step.

2. **Select a cohort of experts to form a pan-European consensus council**, who engage in a series of Delphi surveys*, in order to define gaps and consensus.

   - **10 Clinicians**
   - **3 Payors**
   - **5 Patient representatives**

   from 8 European markets participate in 3 Delphi surveys and 2 discursive meetings.

3. **The consensus council drives the development of a consensus manuscript to highlight where, in the patient pathway, patients would benefit from an elevation in SoC**. Innovative activities are then explored at regional and country levels to disseminate and implement findings.

---

*Delphi process: A blinded, systematic, egalitarian method, accepted in clinical literature as being well-suited to developing clinical recommendations and consensus statements.

---

Epicensus has been designed in an adaptable way, meaning its core principles can be applied to other disease areas to investigate and address elevation in SoC through multidisciplinary engagement.
