Bimekizumab Improvements in Efficacy on Disease Activity Assessed via Composite Endpoints in Biologic DMARD-Naïve and TNFi-IR Patients with Active PsA: Pooled 16-Week Results from Phase 3 Randomized, Placebo-Controlled Studies CONTENT PROVIDED FOR SHAREHOLDERS, INVESTORS AND OTHER CAPITAL MARKET PARTICIPANTS ONLY

Presented at ACR Convergence 2022 | Philadelphia, Pennsylvania, USA | November 10–14

Objective

To assess the efficacy of bimekizumab (BKZ) treatment versus placebo (PBO) on disease activity using composite outcome measures in patients with active psoriatic arthritis (PsA) using pooled data from two phase 3 trials.

Background

- PsA is a disease with multiple manifestations; it is important that the efficacy of new interventions is assessed across the spectrum of the disease using composite endpoints.¹
- BKZ, a monoclonal IgG1 antibody that selectively inhibits IL-17F in addition to interleukin (IL)-17A, has shown efficacy and tolerability up to 16 weeks in patients with active PsA.^{2,3}

Methods

- BE OPTIMAL (NCT03895203) and BE COMPLETE (NCT03896581) are phase 3 studies assessing BKZ in patients with PsA who are biologic DMARD (bDMARD)-naïve or had intolerance or inadequate response to TNF inhibitors (TNFi-IR), respectively (Figure 1).
- The primary endpoint in both studies was the proportion of patients with \geq 50% improvement in American College of Rheumatology criteria (ACR50) response at Week 16; minimal disease activity (MDA) at Week 16 was a secondary endpoint.
- We present pooled and individual study data for BKZ and PBO treatment arms for composite endpoints at Week 16: MDA and very low disease activity (VLDA), Disease Activity in Psoriatic Arthritis (DAPSA), Psoriatic Arthritis Disease Activity Score (PASDAS), and ACR50+Psoriasis Area and Severity Index (PASI)100.
- Non-responder imputation (NRI) and worst-category imputation (WCI) were used for missing binary and multi-category data, respectively.

Results

- A total of 1,073/1,112 (96.5%) patients randomized to BKZ or PBO completed Week 16.
- Baseline characteristics were generally comparable between studies, with numerical differences between BE OPTIMAL and BE COMPLETE for time since PsA diagnosis, concomitant methotrexate, and body surface area (BSA) affected by psoriasis $\geq 3\%$ (Table 1).
- At Week 16 (pooled and individual analyses), a higher proportion of BKZ-treated patients achieved MDA and VLDA versus PBO-treated patients (Figure 2).
- Compared with the PBO group, a higher proportion of BKZ-treated patients achieved low disease activity (LDA) and remission (REM) at Week 16, as measured by DAPSA and PASDAS (Figure 3A–B).
- Numerically higher proportions of BKZ- versus PBO-treated patients achieved ACR50+PASI100 (Figure 3C).

Conclusions

Pooled data demonstrate that numerically higher proportions of bimekizumab-treated patients achieved clinically relevant disease activity thresholds, assessed by composite endpoints, compared with placebo.

Results were consistent between studies, with similar magnitude of response observed, suggesting that bimekizumab treatment leads to improvements in overall disease activity irrespective of prior bDMARD use.

Joints BKZ*: PBO*:

*Based on pooled data for composite endpoints at Week 16

Figure 1

Study designs that made up the pooled population, BE OPTIMAL (NCT03895203) and BE COMPLETE (NCT03896581). Adalimumab 40 mg Q2W served as an active reference arm. BE OPTIMAL was not powered for comparisons of adalimumab to bimekizumab or adalimumab to placebo. Adalimumab 40 mg Q2W data are not shown in this poster.

Summary

Composite endpoints are key in assessing the efficacy of new treatments across multiple domains of PsA.¹ Dactylitis Enthesitis Skin

Numerically higher proportions of BKZ-treated patients achieved clinically relevant disease activity thresholds at Week 16, irrespective of prior bDMARD use:

Results suggest that bimekizumab treatment leads to improvement in overall disease activity. Similar magnitude of response was observed in bDMARD-naïve and TNFi-IR patients.

BE OPTIMAL and BE COMPLETE study designs

A) DAPSA Disease State (WCI)

Randomized set. DAPSA state, PASDAS category, and ACR50+PASI100 responders at Week 16 in patients treated with BKZ and PBO. DAPSA value is >4 and <14, and REM if DAPSA value is >4 and <14, and REM if DAPSA value is >28, MoDA if DAPSA value is >4 and <28, LDA if DAPSA value is >4 and <28, LDA if DAPSA value is >14 and <28, LDA if DAPSA value is >4 and <28, LDA if DAPSA value is >4 and <28, LDA if DAPSA value is >28, MoDA if DAPSA value is >4 and <28, LDA if DAPSA value is >4 and <28, LDA if DAPSA value is >28, MoDA if DAPSA value is >4 and <28, LDA if DAPSA value is >4 and <28, TJC, LEI, tender dactylitis count, SF-36 PCS, and hs-CRP. Patients achieve HDA if PASDAS score is >3.2 and <5.4, LDA if PASDAS score is >3.2 and <3.2, and REM if PASDAS score is >3.2 and <3.2, and REM if PASDAS score is >3.2 and complete skin clearance.

ACR50: >50% improvement in American College of Rheumatology criteria; BKZ: bimekizumab; bDMARD: biologic disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: interleukin; LDA: low disease activity; LEI: Leeds Enthesitis Index; MDA: high disease activity; hs-CRP: high-sensitivity C-Reactive Protein; IL: high disease activity; hs-CRP: high diseas minimal disease activity; MoDA: moderate disease activity; MTX: methotrexate; NRI: non-responder imputation; PASI: Psoriasis Area and Severity Index; PASI100: 100% improvement in PASI; PASDAS: Psoriatic arthritis; PASI: Psoriatic arthritis; PtAAP: Patient's Assessment of Arthritis Pain; Q2W: every two weeks; Q4W: every two weeks; Q4W: every two weeks; Q4W: every two weeks; REM: remission; SD: standard deviation; SF-36: Short-Form 36-item Health Survey; SJC: swollen joint count; TJC: tender joint count; TNFi-IR: intolerance or inadequate response to tumor necrosis factor inhibitors; VAS: visual analog scale; VLDA: very low disease activity; WCI: worst-category imputation.
